

# Ideawake Release Notes – Batch 41.9-CD

**Release Date:** 05/20/2026

## **CD Tasks:**

1. Comments section updated to not be an endless scroll.
2. Added count of custom field entries on custom fields list and made custom fields exportable.
3. Number of ideas now displayed when the additional challenge brief is enabled.
4. Added mail icon next to workflow stages that have notifications enabled on the workflow.

## **Bugs Fixed:**

1. Improved display experience of dates on time series charts.
2. Challenge tags now work when the count of submissions is the y axis on charts.
3. Image now previews in 'edit' mode after scheduling an update.
4. AI training settings bug resolved / Changed edit mode experience to be consistent with the rest of the app.
5. Idea table view modal now closes after updating "User" or "User/Group" custom fields.
6. User ID is now defined.
7. Removed flash of "no community found" on installed Teams integration.

## **CD Tasks Details:**

- 1. Comments section updated to not be an endless scroll.**
  - New and existing comments save, update, and display properly without causing unexpected actions.
- 2. Added count of custom field entries on custom fields list and made custom fields exportable.**
  - Custom Fields module enhancements now ensure accurate submission counts and full data visibility across all fields. Export functionality works seamlessly, preserving all applied filters and exporting data correctly within the module boundaries.

**3. Number of ideas now displayed when the additional challenge brief is enabled.**

- Submission metrics remain fully accurate and visible across all scenarios when the *additional brief* is enabled.

**4. Added mail icon next to workflow stages that have notifications enabled on the workflow.**

- A dedicated status column has been added at the workflow stage level, positioned between the *assignee* and *global status* sections. This update provides immediate visibility into email notification configurations, eliminating the requirement to open individual stages.

**Bugs Fixed Details:**

**1. Improved display experience of dates on time series charts.**

- The *Time Series Chart* UI has been corrected, ensuring the X-axis accurately displays dates in the designated month-date-year format with a consistent two-digit year.

**2. Challenge tags now work when the count of submissions is the Y-axis on charts.**

- Resolved a critical charting issue where data failed to render under specific configurations. The breakdown filter now correctly processes and updates the chart data for the Challenge vs Count of Submissions visualization across all filter operations.

**3. Image now previews in 'edit' mode after scheduling an update.**

- Fixed a session persistence issue within scheduled updates. Uploaded media assets and images now correctly and display accurately upon reopening the update within *edit* mode.

**4. AI training settings bug resolved / Changed edit mode experience to be consistent with the rest of the app.**

- Corrected a configuration resetting error where AI modifications reverted upon navigating adjacent tabs. System settings now persist flawlessly across all events, and a dedicated controls interface has been added to stabilize configuration management.

**5. Idea table view modal now closes after updating “User” or “User/Group” custom fields.**

- Resolved an interface bug within the *Idea Table View*. Modifying specialized custom user fields now triggers a successful data save and automatically terminates the edit modal container as expected.

**6. User ID is now defined.**

- Resolved a redirection and navigation exception originating from user tags. Interacting with tagged or copied profile signatures within the *Activity* tab now successfully queries and loads the correct user ID parameters across all navigation flows.

**7. Removed flash of "no community found" on installed Teams integration.**

- Resolved an interface routing delay within the *Microsoft Teams* integration. The platform now directly initializes and renders the correct community view upon authentication, completely eliminating the temporary "community not found" flash screen and any redundant redirect loops.
